

intelligent, rational, one will appeal to norms. Such norms are no less exigent than natural laws, but they differ from them because they operate not blindly but in knowing and through knowing and, ~~and~~ indeed, by somehow being known; while not limited to the norms of formal logic, they are known as ~~the~~ logic is known before one studies it, and they are effective in and through knowing and by being known in the fashion that logic is effective, that we think and reason logically, even when we do not advert to the objectified rules of  $x$  logic.
